

Agent Canvas quick guide

Use **Home** to ask and act, **Needs you** to review decisions, and **More** for other tools. An agent is an assistant you give a task. Test preview answers are examples.

Sign in and get ready

1. Open Agent Canvas and sign in with your **CTG Google account**. In a test preview, use your own approved email under **Development sign-in**.
2. Choose a **Project space** in the header. If none exists, choose **Create a project space**, name it, keep the starting team and choose **Create**.
3. Open **Connections** and choose **Check now** beside **Answer service**. If a needed service is unavailable, ask Pete to help connect it.

Ask a question and check the answer

1. Open **Home**. Type a question, such as "What should we check before a customer renewal?" Keep **Ask** selected and click **Ask**.
2. Read the answer below. Open **Sources and details** to check its evidence. If it has no supporting sources, verify the answer before using it.
3. Choose **Save** to keep an answer; find it later with **Saved only**. If asked to add an agent first, choose **Add agent**, choose a ready-made agent, then return to your question.

Work from your documents and notes

1. On **Home**, choose **Add document** and select a file, such as a PDF, Word document or spreadsheet, up to 5 MB. Wait for the ready message.
2. Ask a specific question, such as "Summarize the renewal risks in this document." Open **Sources and details** to check what was used.
3. Use **More** → **Documents & notes** to read or download files and add notes. Pin a note to include it in future agent work in this space.

Turn an answer into work

1. Choose **Act on this** beneath an answer. It attaches that answer and selects **Act**; nothing is submitted yet.
2. Type what you want next, such as "Draft a short renewal checklist for review." Check the attached answer; **Clear answer context** removes it if needed.
3. Click **Act** and wait for the result. Emails remain drafts. The real HubSpot account is read-only. Changes in the practice account require a preview and approval in **Needs you**.

Answer an item in Needs you

1. Open **Needs you**. Use **Mine** for your items or **Team / All** for other accessible items. Owners start on **All**.
2. Read the project name, question and **What you need to know**. For proposed changes, compare **Current value** with **Proposed value**.
3. Choose **Answer**, write your decision and click **Submit answer**. Wait until the card clears. If anything is unclear, use your answer to ask for clarification.

If something does not work

Try again reloads a failed view. If a change is **not confirmed**, choose **Check status** before submitting again. Copy unsaved text before reloading. Use **Pause** to stop work; only the owner can resume it. For help, give Pete the project name and what you were doing.

Manage work and company knowledge

Start with the same project space. Some steps below need the owner. If you only have permission to view, ask Pete to make changes.

Review a deal or client in a Room

1. Open **More** → **Rooms** and choose a Room. Use **Now**, **History** or **Risk** to change the view; **Activity** shows recent work.
2. Choose **Refresh room**, wait for completion, then open **View refresh work** and review the result before relying on the brief.
3. **Owner only:** To create one, enter its name and type, choose who can see it, then **Create room**. To export, open **Export...**, review inclusions, exclusions and warnings, then choose **Download client-safe HTML**.

Correct something the company remembers

1. Open **More** → **Memory**. Search for the entry and read its certainty label. **History and sources** shows where it came from.
2. Choose **Correct...**, enter the replacement, select its certainty, explain why it changed and click **Correct**. The original stays in the history.
3. Turn on **Include earlier versions** to compare entries. Corrections belong to this project space; they are not automatically copied everywhere.

Certainty means **Confirmed (verified)**, **Reasoned conclusion (inference)** or **Unconfirmed (assumption)**. Check sources even when a label says Confirmed.

See how an answer was produced

1. Beneath an answer, choose **View work**, then **Why?** → **Map**. Choose **Read as steps** for a simple list of the recorded steps.
2. Use **Flow** for what happened, **Evidence** for recorded support, and **Impact** for the work that followed. Open source links to check the original information.

Set up recurring work

1. Open **More** → **Scheduled work**. Describe the task, for example "Prepare my weekly operating brief every Monday morning," then choose **Interpret**.
2. Review what it will do, sources, permissions, cost limits, schedule and expiry. Open **Settings** to adjust them. Check the local-time equivalent of the displayed **UTC** time.
3. **Owner:** Choose **Rehearse** for a practice check, wait for completion and review the result. Use that same account to choose **Activate**.
4. Check work history for completed results; saving a schedule does not mean it ran. The owner can **Pause**, **Resume** or **Revoke** its permission to run again.

Build an agent for a specific job

1. Open **More** → **Team** → **Advanced** → **Build an agent**. Describe the job in plain English and choose **Propose agent**.
2. Review its instructions, when to ask a human, permissions and spending limits. Save any changes, choose **Rehearse**, then review the completed result.
3. **Owner:** Choose **Publish** to add it to the team. Review **What changed**. Changing permissions requires another rehearsal before publishing.
